

# Package ‘SGCS’

April 8, 2012

**Title** Spatial Graph based Clustering Summaries for spatial point patterns

**Version** 1.7

**Date** 2012-04-08

**Author** Tuomas Rajala

**Maintainer** Tuomas Rajala <tuomas.rajala@iki.fi>

**Depends** spatstat

**Description** Graph based clustering summaries for spatial point patterns. Includes Connectivity function, Cumulative connectivity function and clustering function, plus the triplet intensity function T.

**License** GPL (>= 2)

**Repository** CRAN

**Date/Publication** 2012-04-08 10:51:51

SGCS-package

*Spatial point process statistics based on a geometric graph.*

---

## Description

Three statistical spatial point pattern measures, based on a graph structure over the point pattern data.

### Functions

-----  
confun - Connectivity function  
cumconfun - Cumulative connectivity function  
clustfun - Clustering function  
Tfun - Triplet intensity function T

The connectivity function estimates the probability that two points distance  $r$ -apart share a graph component. Cumulative connectivity function is like Ripley's  $K$ -function but conditioned on the points sharing a graph component. Clustering function is a functional form of the non-spatial graph index, clustering coefficient. Tfun is the intensity of  $r$ -triplets.

The package currently supports only geometric graph, but such graphs as  $k$ -nearest neighbours graph can be easily included if somebody is interested.

SGCS-funs

*Connectivity function, Cumulative Connectivity function and Clustering Function.*

---

## Description

Statistical measures based on edges of a geometric graph structure over a given point pattern data.

The graph given components are used as clusters. In this version we use geometric graph, meaning points  $x$  and  $y$  are connected if  $\|x-y\|<R$  for the given range parameter  $R$ . Notice that in clustering function, the  $R$  equals to the parameter  $r$ . If you have a another clustering structure in mind, you can give the spatgraphs-object using the `prepGraph` parameter.

The main function is `spatial.graph.cluster.Fun`, but the use of shortcuts `confun`, `cumconfun` and `clustfun` is highly encouraged.

In addition, the triplet intensity function  $T$  (Schladitz & Baddeley 2000) is also included for now: The `Tfun`.

## Usage

```
confun(X, r=NULL, R=NULL, h=NULL, ...)
cumconfun(X, r=NULL, R=NULL, ...)
clustfun(X, r=NULL, ...)
Tfun(X, r=NULL, ...)
spatial.graph.cluster.Fun(X, r=NULL, funtype=1, funpars=0,
  minusRange=NULL, toroidal=FALSE,
  doDists=FALSE, doWeights=FALSE,
  prepGraph=NULL, dbg=FALSE)
```

## Arguments

<code>X</code>	All: Point pattern object of class <code>ppp</code> from package <code>spatstat</code> .
<code>r</code>	Vector of the range parameters in which to calculate the function value. if <code>NULL</code> , a range from 0 to 1/3 of window length is used.
<code>R</code>	<code>confun</code> , <code>cumconfun</code> : Clustering radius of the graph. If <code>NULL</code> , $R=1/\sqrt{\lambda}$ .
<code>h</code>	<code>confun</code> : Smoothing parameter in kernel-estimation. Box kernel width = $2h$ . <code>NULL</code> -> $h=0.15*R$
<code>...</code>	Parametes for the function <code>art1Fun</code> :
<code>funtype</code>	(shortcuts handle) Which function to calculate. <code>confun=1</code> , <code>cumconfun=2</code> , <code>clustfun=3</code> , <code>Tfun=4</code> .
<code>funpars</code>	(shortcuts handle) Additional function parameter(s): <code>confun fpar=c(R,h)</code> , <code>cumconfun fpar=R</code> .
<code>minusRange</code>	<code>clustfun</code> , <code>Tfun</code> : Minus-correction parameter. Rectangular window required, <code>NULL</code> means no correction.
<code>toroidal</code>	<code>clustfun</code> , <code>Tfun</code> : Toroidal correction of rectangular window.
<code>doDists</code>	Precalculate distances for faster computation. Be aware of memory consumption $n*(n-1)$ .
<code>doWeights</code>	<code>confun,cumconfun</code> : Precalculate translation correction weights for faster computation. Be aware of memory consumption $O(n^2)$ .
<code>prepGraph</code>	An optional graph-object from <code>spatgraphs</code> to be used as the component division of the points.
<code>dbg</code>	Print additional messages.

**Value**

Object of class `fv`, see `spatstat` for details. Has `plot`, `envelope` etc. nice methods.
